MINI PROJECT — PROTOTYPE DESIGN

EduLearn — Clickable Online Learning Platform

Project Type	Mobile education / e-learning application
Design Tool	Figma (recommended for the clickable prototype)
Target Users	College students and beginners learning technical and professional skills
Primary Goal	Help learners discover courses, enroll, study lessons, and monitor progress with minimal friction.

1. Project Overview

EduLearn is a mobile learning platform designed around a simple learner journey: sign in → discover a course → inspect course details → enroll → watch lessons → track progress. The prototype focuses on the core happy path while also providing profile and progress management.

Design objectives

• Make course discovery fast through search, categories and personalized recommendations.

• Provide enough course information to support an enrollment decision.

• Keep lesson navigation simple so users can move between previous and next lessons.

• Make learning progress visible through completion percentages and course history.

• Use consistent components, spacing, typography and navigation across screens.

2. Prototype Structure & User Flow

Screen	Purpose	Primary interaction
01. Login / Sign Up	Account access	Login / Sign Up → Home
02. Home	Discover learning content	Search, category or course → Course List / Details
03. Course List	Compare available courses	Select course → Course Details
04. Course Details	Evaluate and enroll	Enroll Now → Lesson
05. Video / Lesson	Complete learning content	Mark Complete → Next / Previous
06. Profile / Progress	Review learning activity	View progress, certificates, settings

Prototype navigation map

Login	Home	Course List	Course Details	Lesson	Profile
→	→	→	→	→	↔
Sign Up	Search / Category	Select Course	Enroll Now	Next / Complete	Progress / Settings

Clickable interactions to implement in Figma

• Login button → Home screen.

• Course card / search result → Course Details.

• Enroll Now → Video / Lesson screen.

• Next → next lesson state; Previous → previous lesson state.

• Mark as Completed → updated progress state.

• Bottom navigation → Home, Courses, Progress and Profile destinations.

• Back arrows → return to the previous screen.

3. Visual Design & UX Rationale

Visual system

Element	Specification
Primary color	#4F46E5 — buttons, active states and key actions
Secondary color	#12B76A — completion and success states
Background	#F6F8FC — light, low-distraction app background
Typography	Inter — clean sans-serif with clear hierarchy
Buttons	Rounded 10–12 px corners; strong contrast; clear action labels
Cards	Rounded cards with subtle borders/shadows to separate course content
Icons	Simple outline icons with consistent stroke weight

UI/UX principles applied

Consistency: the same bottom navigation, button style and card structure are reused across screens.

Visual hierarchy: course titles and primary actions are visually stronger than supporting metadata.

Recognition over recall: users see course progress, categories and lesson state instead of having to remember them.

Feedback: completion indicators and progress percentages show the result of user actions.

Accessibility: high-contrast text, large touch targets and descriptive labels are used for important actions.

Minimal cognitive load: each screen emphasizes one primary task and avoids unnecessary controls.

Expected outcome

The prototype demonstrates a complete, coherent learning journey rather than isolated screens. The main success criterion is whether a first-time user can move from login to course completion without needing external instructions.

Submission note: Paste your Figma prototype URL on the first page or in your submission portal. The clickable prototype should contain the six screens and interactions listed above.
